2D-PDM: three-stream RGB-D framework

Single-view scene observation

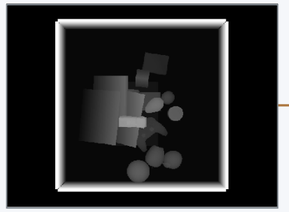

1. Inputs

Scene RGB I

640 × 480

Observed depth D

Registered to RGB

Target reference

RGB thumbnail + text

Reference mask

Text prompt

2a. Similarity stream

Trained; frozen for fusion

F DINOv3 scene + target RGB

Four scene feature layers

target

F SigLIP target RGB + text

T Masked pooling + semantic adapter

reference mask

T Multi-layer matching + feature CNN

F_S

64×30×40

1×1+σ

S map

2b. Occlusion stream

Trained; frozen for fusion

F DINOv3 scene + target RGB

Four scene feature layers

Target: full-frame mean pooling

T Depth ResNet18 depth + valid mask

T Global FiLM geometry 68 + MLP

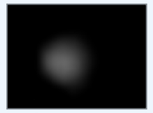

T Multi-layer matching + feature CNN

F_O

64×30×40

1×1+σ

O map

workspace mask

2c. Complexity stream

Trained; frozen for fusion

F DINOv3 RGB last-layer features

Layer 11 features

T RGB CNN

F MultiMAE observed-depth encoder

Depth encoding; no depth prediction

T Projection + concat dilated CNN

F_C

64×30×40

Softplus

C map

3. Feature fusion

SOC: trained 13 epochs; best 10

Concatenate stream features

$[F_S; F_O; F_C]$

192 × 30 × 40

1×1 Conv: 192 → 64
GN8 + GELU

3×3 Conv: 64 → 64
GN8 + GELU
× 2 blocks

1×1 Conv: 64 → 1
logits

σ: 1 × 30 × 40

Prediction **Amodal GT**

Actual output Native mask

BCEWithLogits
GT = avg16(amodal mask)

One learned CNN; no attention

Individual training Separate supervision with similarity, occlusion and regional-complexity GT.

F Frozen pretrained backbone **T** Module learned in its stream Feature tiles are schematic; map thumbnails are actual test predictions.

Fusion: all S/O/C modules frozen. One shared scene DINO forward; repeated nodes show logical uses.

SOC fusion head completed

Five fixed test examples inferred.

Full test evaluation still pending.
